Motivation of Scrum usage

We made some adjustments during the context project; sometimes because a TA recommended it, sometimes because we encountered difficulties.

Sprint #2 (May 2–4)

- Started using waffle.io as a project management tool, because it nicely shows the todo's in a Scrum-like way, and it is integrated with GitHub issues and pull requests.
- Started using points instead of hours in the sprint backlog, because it is difficult to precisely estimate the time to spend at an issue.[1]

Sprint #3 (May 9–13)

- Slightly adjusted the points in the sprint backlog, which should be fitting for all issues. [2]

Sprint #4 (May 16–20)

- Included a link to our waffle.io page, and a column containing the waffle issue numbers for each action point in the sprint backlog/retrospective. This is a way for the TA's to see when issues are closed, and when there are (code) commits, the pull request is mentioned in the issue.
